Dear Hiring Manager,

Here is what I would bring to identifying, engaging, and managing influencer relationships for your security brand:

1. A vetting process built for a technical buyer, not a consumer one -- filtering influencers on credibility with IT/security audiences, not follower count, so partnerships build trust instead of just reach.
2. A relationship-management and content-planning system that keeps outreach, campaign execution, and follow-through organized, so influencer activity compounds instead of resetting with every new partner.
3. Performance tracking built around qualified leads, not engagement vanity metrics -- the same attribution discipline I use to prove real pipeline impact, not just impressions.

Direct proof this transfers: I built B2B lead-generation funnels and GA4/HubSpot attribution infrastructure from the ground up for Zonia Hub, a B2B marketplace, improving lead quality and giving leadership a clear, defensible read on what was actually working. I have also run paid brand-partnership and influencer-adjacent collaboration work for a fintech client, generating \$5,000+ in monetized revenue within 30 days off the resulting audience.

One honest note: my direct vertical experience is in B2B marketplaces and fintech, not IT security specifically. The underlying problem -- turning niche technical credibility into measurable pipeline -- is the same one, and I would bring the same rigor to the security-audience nuance rather than treat it as generic B2B.

I would welcome the chance to walk through how I would approach influencer identification and the first campaign in week one.

Best,
Chinwendu Marvellous Ajaegbu-Caleb
